

Bark Mounts

Bark objects are particularly susceptible to the effects of temperature and relative humidity fluctuation, and the method by which the object is displayed can cause significant damage if not properly considered.

Being a natural fibre, bark will expand, contract, and change shape depending on the temperature and level of moisture in the atmosphere.

By restricting this natural movement, cracking and splitting can occur. When displaying bark paintings or objects you must provide the correct amount of structural support to the object, at the same time allowing a degree of movement should the bark want to move.

All Pod bark mounting systems are customised to the object and can be easily adjusted to avoid a buildup of tension around the object. Each mount provides a padded rear framework, with adjustable clips and hanging system for displaying on a wall or within a space.
